

The `getttitlestring` package

Heiko Oberdiek
<heiko.oberdiek at googlemail.com>

2010/12/03 v1.4

Abstract

The L^AT_EX package addresses packages that are dealing with references to titles (`\section`, `\caption`, ...). The package tries to remove `\label` and other commands from title strings.

1 Documentation

1.1 Macros

`\GetTitleStringSetup {⟨key value list⟩}`

The options are given as comma separated key value pairs. See section [1.2](#).

`\GetTitleString {⟨text⟩}`
`\GetTitleStringExpand {⟨text⟩}`
`\GetTitleStringNonExpand {⟨text⟩}`

Macro `\GetTitleString` tries to remove unwanted stuff from `⟨text⟩` the result is stored in Macro `\GetTitleStringResult`. Two methods are available:

`\GetTitleStringExpand`: The `⟨text⟩` is expanded in a context where the unwanted macros are redefined to remove themselves. This is the method used in packages `titleref` [\[2\]](#), `zref-titleref` [\[3\]](#) or class `memoir` [\[1\]](#). `\protect` is supported, but fragile material might break.

`\GetTitleStringNonExpand`: The `⟨text⟩` is not expanded. Thus the removal of unwanted material is more difficult. It is especially removed at the start of the `⟨text⟩` and spaces are removed from the end. Currently only `\label` is removed in the whole string, if it is not hidden inside curly braces or part of macro definitions. Thus the removal of unwanted stuff might not be complete, but fragile material will not break. (But the result string can break at a later time, of course).

Option `expand` controls which method is used by macro `\GetTitleString`.

`\GetTitleStringDisableCommands {⟨code⟩}`

The `⟨code⟩` is called right before the text is expanded in `\GetTitleStringExpand`. Additional definitions can be given for macros that should be removed. Keep in mind that expansion means that the definitions must work in expandable context. Macros like `\@ifstar` or `\@ifnextchar` or optional arguments will not work. The macro names in `⟨code⟩` may contain the at sign `@`, it has catcode 11 (letter).

1.2 Options

`expand`: Boolean option, takes values `true` or `false`. No value means `true`. The option specifies the method to remove unwanted stuff from the title string, see below.

Options can be set at the following places:

- `\usepackage`
- Configuration file `getttitlestring.cfg`.
- `\GetTitleStringSetup`

2 Implementation

1 `⟨*package⟩`

Reload check, especially if the package is not used with \LaTeX .

2 `\begingroup\catcode61\catcode48\catcode32=10\relax%`
3 `\catcode13=5 % ^~M`

4 Installation

4.1 Download

Package. This package is available on CTAN¹:

[CTAN:macros/latex/contrib/oberdiek/gettitlestring.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/gettitlestring.pdf](#) Documentation.

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for T_EX Files” ([CTAN:tds/tds.pdf](#)). Directories with `texmf` in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory `TDS:scripts/oberdiek/` for scripts that need further installation steps. Package `attachfile2` comes with the Perl script `pdfatfi.pl` that should be installed in such a way that it can be called as `pdfatfi`. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

4.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain T_EX:

```
tex gettitlestring.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

| | |
|--|---|
| <code>gettitlestring.sty</code> | → <code>tex/generic/oberdiek/gettitlestring.sty</code> |
| <code>gettitlestring.pdf</code> | → <code>doc/latex/oberdiek/gettitlestring.pdf</code> |
| <code>test/gettitlestring-test1.tex</code> | → <code>doc/latex/oberdiek/test/gettitlestring-test1.tex</code> |
| <code>test/gettitlestring-test2.tex</code> | → <code>doc/latex/oberdiek/test/gettitlestring-test2.tex</code> |
| <code>gettitlestring.dtx</code> | → <code>source/latex/oberdiek/gettitlestring.dtx</code> |

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

4.4 Refresh file name databases

If your T_EX distribution (teT_EX, miK_TE_X, ...) relies on file name databases, you must refresh these. For example, teT_EX users run `texhash` or `mktextlsr`.

¹<ftp://ftp.ctan.org/tex-archive/>

4.5 Some details for the interested

Attached source. The PDF documentation on CTAN also includes the `.dtx` source file. It can be extracted by AcrobatReader 6 or higher. Another option is `pdftk`, e.g. unpack the file into the current directory:

```
pdftk gettitlestring.pdf unpack_files output .
```

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain T_EX: Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{gettitlestring.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex gettitlestring.dtx
makeindex -s gind.ist gettitlestring.idx
pdflatex gettitlestring.dtx
makeindex -s gind.ist gettitlestring.idx
pdflatex gettitlestring.dtx
```

5 Catalogue

The following XML file can be used as source for the [T_EX Catalogue](#). The elements `caption` and `description` are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is `gettitlestring.xml`.

```
403 <?catalogue>
404 <?xml version='1.0' encoding='us-ascii'?>
405 <!DOCTYPE entry SYSTEM 'catalogue.dtd'>
406 <entry datestamp='$Date$' modifier='$Author$' id='gettitlestring'>
407   <name>gettitlestring</name>
408   <caption>Clean up title references.</caption>
409   <authorref id='auth:oberdiek'>/>

7 History

[2009/12/08 v1.0]

- The first version.

[2009/12/12 v1.1]

- Short info shortened.

[2009/12/13 v1.2]

- Forgotten third argument for `\InputIfFileExists` added.

[2009/12/18 v1.3]

- `\Hy@SectionAnchorHref` added for filtering (hyperref 2009/12/18 v6.79w).

[2010/12/03 v1.4]

- Support of package `enumitem`: removing `\enit@format` from title string (problem report by GL).

8 Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
